Food Transport Box Instructions

www.thermometer.ie

RT600 Transport Box

This box is a standard passive cooler box that requires the use of ice packs and constant monitoring of the temperature via the built in display.

- Insulated Box.
- Built in temperature display
- Supplied with a full certificate of calibration traceable to national standards.
- Supplied with colour coded food labels
- Low cost Annual Certification with Reitech.

Temperature Display

- The temperature display is mounted externally so that the internal temperature where the probe is located can be visually monitored .
- The temperature sensor which is the small metal probe at the end of the cable should be place among the produce being transported,
- Calibration – There is no need to return the entire box for calibration. The display can be easily removed by pulling it gently outwards and feeding the probe through the hole on the box.

Cleaning

We recommend cleaning both the interior and exterior of the box firstly with a disposable cloth soaked with water and a standard household detergent for washing dishes, then dry using a disposable paper towel and finish off by thoroughly wiping the interior with a hard surface antibacterial wipe suitable for the type of product you are transporting.

Never immerse the box in water as the display electronics are not sealed and will cause irreversible damage.
